Problem Statement

***“Analysis of the current status of
Ukraine affected by Russo-Ukraine
War (from Twitter data)”***

Data Gathering

Data Gathering Flow

Data Understanding

Obtained Dataset

Our dataset obtained via Twitter API consists of data related to tweets stored in a .csv format with the attributes:

#	Column	Non-Null Count	Dtype
0	created_at	1136882 non-null	datetime64[ns]
1	hashtags	173892 non-null	object
2	id	1136882 non-null	int64
3	lang	1136882 non-null	object
4	retweet_count	1136882 non-null	int64
5	source	1136882 non-null	object
6	text	1136882 non-null	object
7	user_created_at	1136882 non-null	datetime64[ns]
8	user_id	1136882 non-null	int64
9	user_location	668836 non-null	object
10	user_verified	1136882 non-null	bool

dtypes: bool(1), datetime64[ns](2), int64(3), object(5)
memory usage: 96.5+ MB

Majority of the People
didn't use any hashtags
Or share their location
While tweeting about the
crisis still being vocal about
their thoughts on the
matter making twitter a
source of vast range of
emotion and information

As evident from the plot, there is a large proportion of the Americans being vocal about the speculation about the crisis, involvement in which is deterministic for diplomatic relations between the US and Russia

Data Preprocessing

President Biden

@POTUS

United States government official

From the beginning of this crisis, I have been clear and consistent: The United States is prepared no matter what happens.

We are ready for diplomacy to improve stability and security in Europe as a whole.

And we are ready to respond decisively if Russia attacks Ukraine.

Tweet Text Preprocessing

We perform the necessary text preprocessing steps on the Tweet text:

1. Removal of links to websites, such as news sites, youtube, etc.
2. Removal of punctuation and special characters.
3. Removal of stop words
4. Performing of stemming.
5. Performing lemmatization.
6. Creation of n-grams of chosen topics in the form of keywords.
7. Creation of corpus that is to be analyzed.

attacks Ukraine

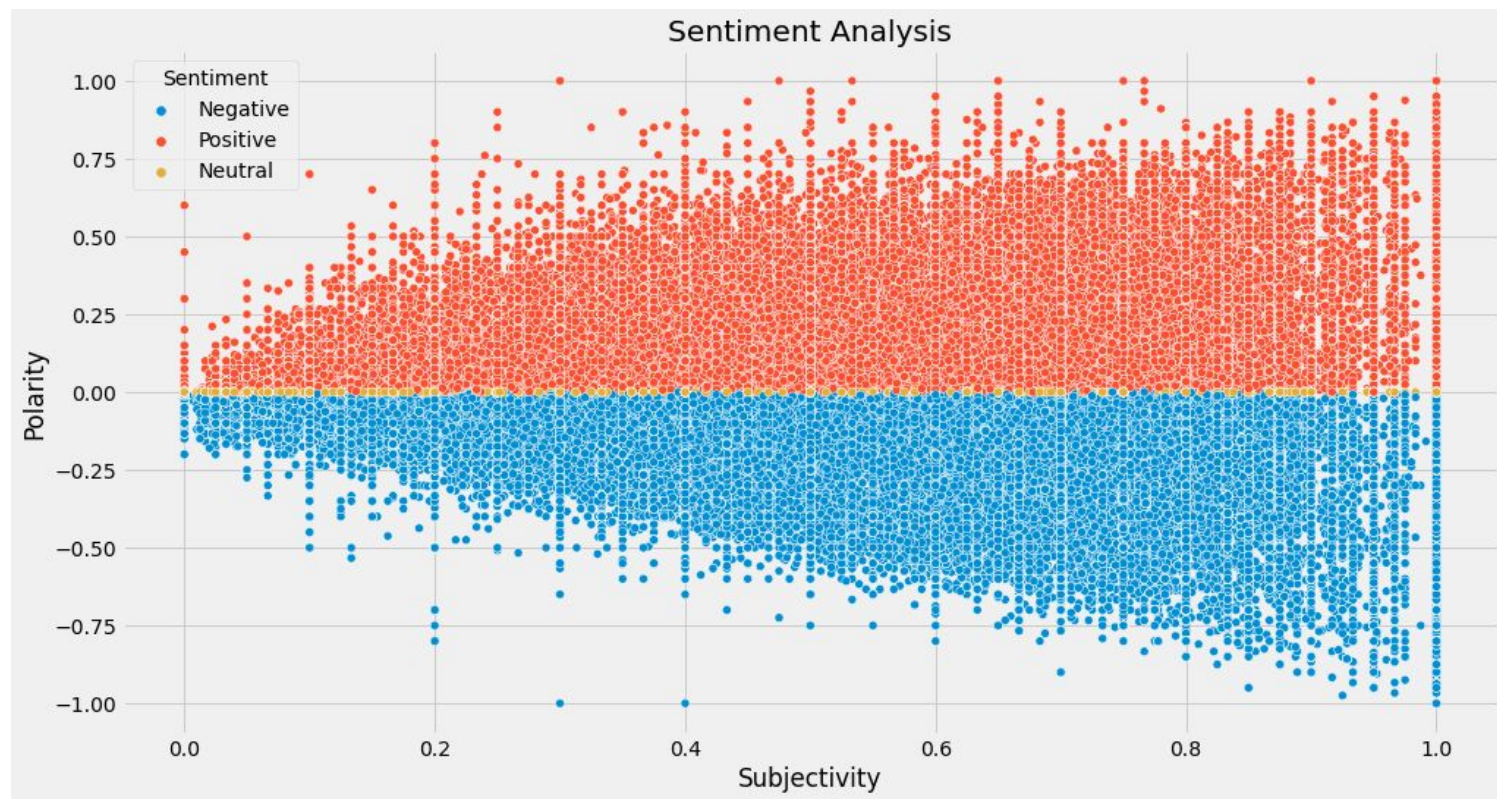

Data Visualization

As evident from the plot, there is a large proportion of the Americans being vocal about the speculation about the crisis, involvement in which is deterministic for diplomatic relations between the US and Russia

Besides the neutral sentiment, that includes discussions of the crisis, its impact on the globe, etc., there is a large positive sentiment of tweets in our data.

Approach To Analysis & Model Building I

Approach To Analysis & Model Building I

Determine how prevalent the topic of Ukraine's socio-economic conditions is in the tweets made in context of the Russo-Ukrainian crisis.

Relevancy & Overlap Of Topics

For making appropriate predictions, we are using the LDA (Latent Dirichlet Allocation) algorithm which is an unsupervised machine-learning model that takes documents as input and finds topics as output. The model also says in what percentage each document talks about each topic.

A topic is represented as a weighted list of words:

Ukraine * 0.9 | Russia * 0.65 | peace * 0.19 | ...

Significance Of LDA Algorithm

From our considered tweet text, it was difficult to derive a problem/topic to focus on, so we used LDA to see the relevancy of topics, as in understand what topics are more talked about.

By performing LDA, we derived that “economy” was a highly significant topic, so we decide to focus on the same. From our domain understanding we know that we need to try to forecast the situation of the Ukrainian economy. This can be derived from the user sentiment with regards to it, which may or may not align with actual events.

LDA Plot

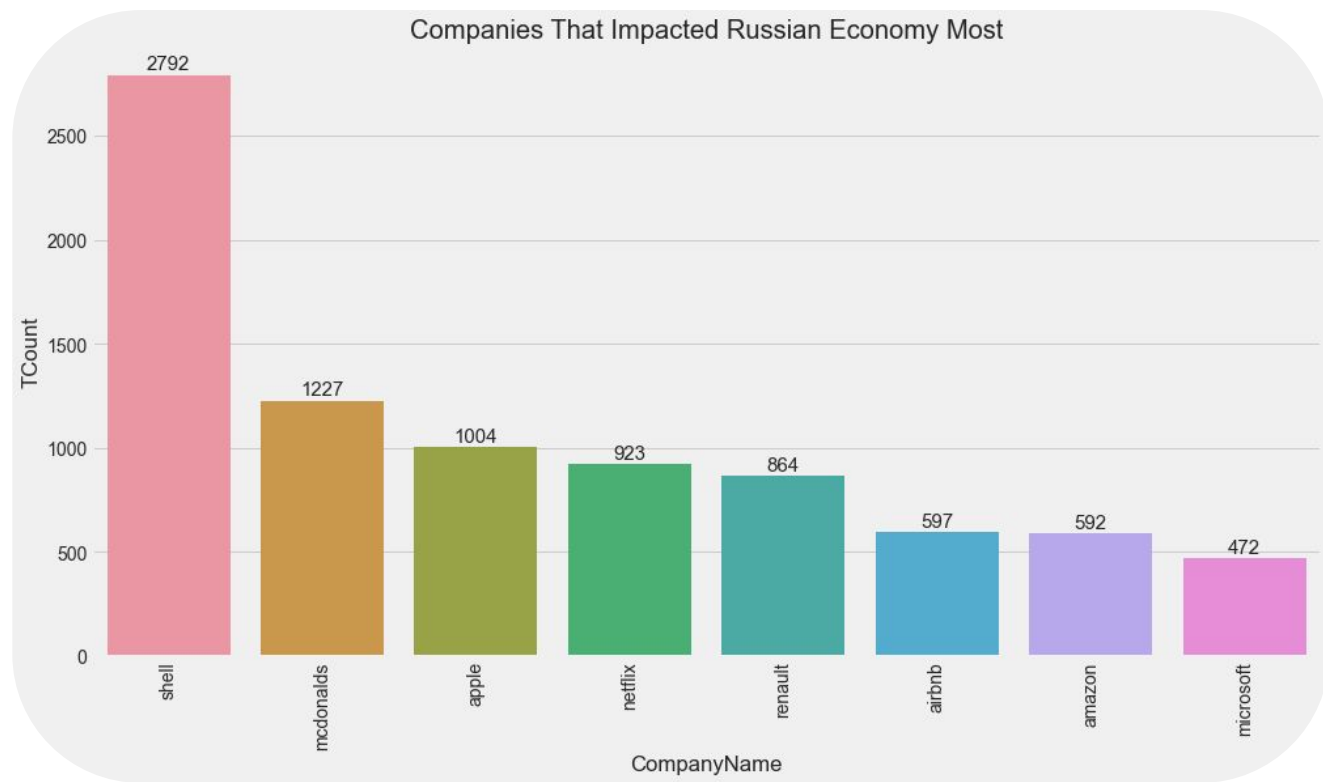

Overall term frequency

Estimated term frequency within the selected topic

1. $s_{\text{salency}}(\text{term } w) = \text{frequency}(w) * (\sum_t p(t|w) * \log(p(t|w)/p(t)))$ for topics t , see Chuang et al (2012)

2. $\text{relevance}(\text{term } w, \text{topic } t) = \lambda * p(w|t) + (1 - \lambda) * p(w, t)/p(w)$, see Sievert & Shirley (2014)

Companies with
a significant
impact on the

economy

Question, Analysis & Inference

Question 1

“What is the general sentiment regarding the situation and further developments that can take place in the Ukrainian economy gravely affected by the war?”

Here, we are looking into the analysis of a multitude of factors that directly or indirectly impact the Ukrainian as well as global economy.

Approach To Analysis & Model Building II

Approach To Analysis II

Predicting the future public sentiment regarding
developments in the Ukrainian economy

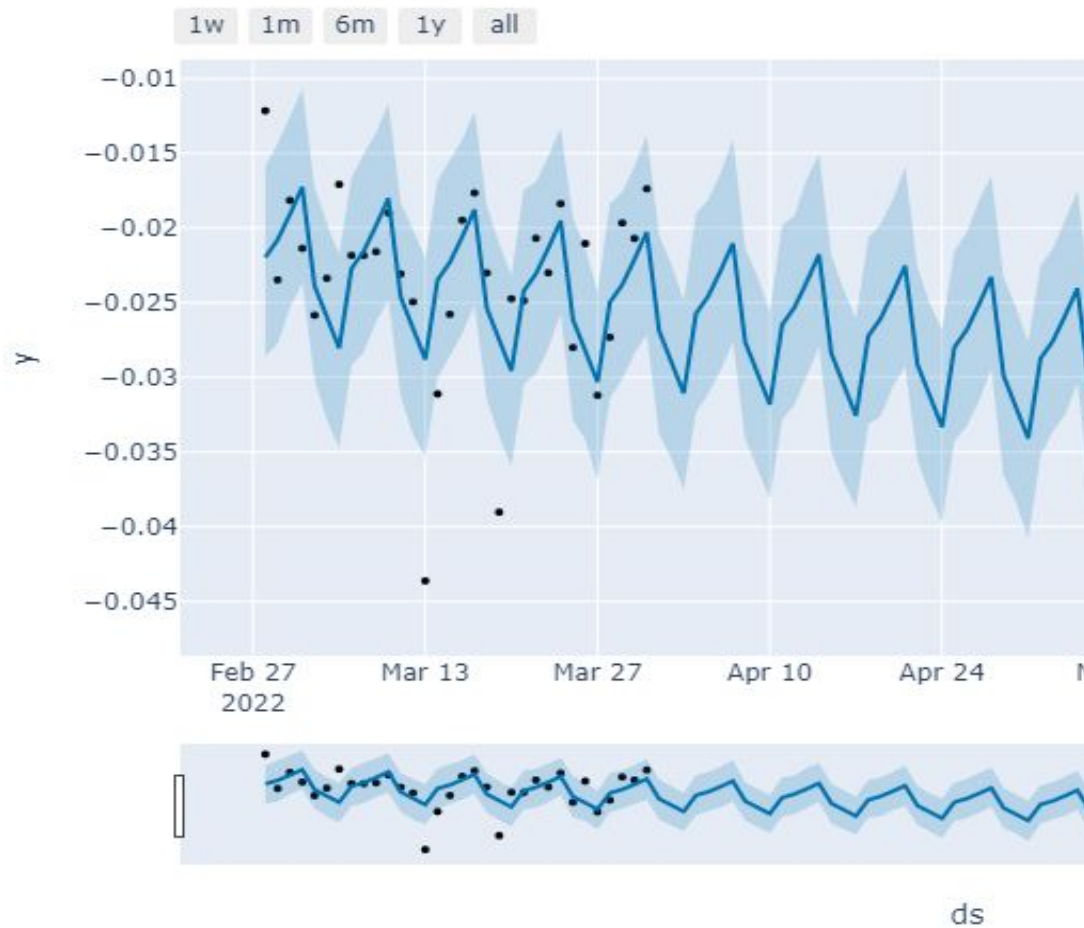

Predicting / Forecasting Future Sentiment

Here, we are making use of the Prophet Model which is an open source library published by Meta that is based on decomposable (trend+seasonality+holidays) models.

It provides us with the ability to make time series predictions with good accuracy using simple intuitive parameters and has support for including impact of custom seasonality and holidays.

Significance Of Prophet Algorithm

We decided to use Prophet algorithm as it converts the data into stationary form and it has clearer visualization compared to other similar models/methods.

Prediction plot showing the growing negative concern regarding economy.

Inference

From the previous plot, we can infer that there will be a growing negative sentiment regarding the Ukrainian economy, which may imply that the Ukrainian economy is on a way to shrinking, making it very difficult for the country to be brought back up to the pre-war Ukrainian standard of living.

Weekly & Daily Trend

Inference

From the previous plot, we can infer that on a weekly & daily basis, the concern for the Ukrainian economy fluctuates, but peaks every week. This is potentially due to news reports that are generated in context of the crisis on a daily & weekly basis.

Question 2

“Predicting what is the general stance regarding Ukraine in the Russo-Ukrainian crisis?”

Here we are trying to segregate the data into two groups mainly, “In Support” and “Not in Support”

Segregated Data

Naive Bayes Algorithms

Gaussian Naive Bayes

Accuracy: 35%

Precision Score: 15%

Multinomial Naive Bayes

Accuracy: 91%

Precision Score: 81%

Bernoulli Naive Bayes

Accuracy: 99%

Precision Score: 95%

Conclusions

From our analysis, we have concluded that there is a growing concern regarding the state of Ukraine, under the Russo-Ukrainian crisis and a general support for Ukraine against Russian aggression that needs to end.

Thank you
